

300A, 60/96V Single Channel Brushed DC Motor Controller

Roboteq's RGDC18xx is a very high current, feature-packed motor controller for Brushed DC motors. The controller features a high-performance 32-bit microcomputer and 2 quadrature encoder inputs to operate in open or closed loop speed mode, position mode or in torque mode. The RGDC18xx features several Analog, Digital and Pulse I/Os which can be remapped as command or feedback inputs, limit switches, or many other functions.

The RGDC18xx accepts commands received from an RC radio, Analog potentiometer, wireless modem, PLC, or microcomputer. Using CAN bus, as many as 127 controllers can be networked at up to 1Mbit/s on a single twisted pair. Numerous safety features are incorporated into the controller to ensure reliable and safe operation.

The controller's operation can be extensively automated and customized using a built-in simple programming language. The controller can be configured, monitored and tuned in real-time using a Roboteq's free PC utility. The controller can also be reprogrammed in the field with the latest features by downloading new operating software from Roboteq.

Applications

- Electric vehicles
- Personnel carriers
- Golf cars
- Materials handling equipment
- Electric boats
- Automatic Guided Vehicles
- Agricultural robots
- Warehouse automation
- Forklifts

Features List

- 0-5V Analog, RS232 or TTL Serial, RS485 or Pulse (RC radio) command modes
- CAN bus interface up to 1Mbit/s with multiple protocol support
- Auto switch between serial, Analog, or Pulse based on userdefined priority
- Built-in high-power drivers for one brushless DC motor at up to 300A
- Support for 10 KOhm NTC temperature sensors through analog inputs (requires an external 10 KOhm pull-up resistor)
- Full forward & reverse control. Four quadrant operation. Supports regeneration
- Operates from a single power source
- Programmable current limit up to 300A for protecting controller, motors, wiring and battery
- Accurate speed and Odometry measurement using Hall Sensor or encoder data
- Up to 8 Analog Input for use as command and/or feedback
- Up to 8 Pulse Width, Duty Cycle or Frequency Inputs for use as command and/or feedback
- Up to 10 Digital Inputs for use as Deadman Switch, Limit Switch, Emergency stop or user inputs
- Two Quadrature Encoder inputs with 32-bit counters
- Built-in Programming language for automatic operation and/or customized functionality
- Five general purpose 1A output for brake release or accessories. Two outputs PWM-capable
- Selectable min, max, center and deadband in Pulse and Analog modes

- Selectable exponentiation factors for each command inputs
- Trigger action if Analog, Pulse or Encoder capture are outside user selectable range (soft limit switches)
- Open loop or closed loop speed control operation
- Closed loop position control with encoder, hall sensors, analog or pulse/frequency feedback
- Precise speed and position control when Encoder feedback is used
- Torque mode
- PID control loop
- Configurable Data Logging of operating parameters on Serial Output for telemetry or analysis
- Built-in Battery Voltage and Temperature sensors
- Regulated 5V output for powering Encoders, RC radio, RF Modem or microcomputer
- Programmable acceleration and deceleration
- Programmable maximum forward and reverse power
- Ultra-efficient 0.33 mOhm ON resistance MOSFETs
- Separate current sensors for Motor Amps and Battery Amps measurement
- Stall detection and selectable triggered action if Amps are outside user-selected range
- Overvoltage and Undervoltage protection
- Programmable Watchdog for automatic motor shutdown in case of command loss
- Overtemperature protection
- Diagnostic LEDs
- Efficient heat sinking using conduction bottom plate
- Dustproof and weather resistant. IP56 NEMA rating
- Power wiring via high amperage power terminals
- 5.51" (140mm) L, 7.87" (200mm) W, 2.28" (58mm) H
- -40° to +85° C operating environment
- 5.0lbs (2.3kg)
- Easy configuration, tuning and monitoring using provided PC utility
- Field upgradeable software for installing latest features via the Internet

RGDC1896	1	300	96	No	No

Warning

A dangerous uncontrolled motor runaway condition can occur due to various reasons, including, but not limited to: command or feedback wiring failure, configuration errors, faulty firmware, errors in user scripts or programs, or controller hardware failure.

Users must be aware that such failures can occur and must ensure the safety of their system under all conditions. Roboteq will not be held liable for any damage or injury resulting from product misuse or failure.

Important Note

All products are not serviceable. If damage is suspected, the item must be replaced rather than repaired.

Attempting to service or repair the product voids any existing warranty and may pose safety risks.

Consult customer support for more information on replacements.

Power Terminals Identifications and Connection

Power connections are made by means of high amperage power terminals located at the top of the controller.

Warning: Properly identify PowerControl pin 25 before applying high voltage to it

FIGURE 1. Top Controller Layout

Figure 2, below, shows how to wire the controller and how to turn power On and Off.

FIGURE 2. Powering the Controller. Thick lines identify **MANDATORY** connections

Caution

Carefully follow the wiring instructions provided in the Power Connection section of the User Manual. The information on this datasheet is only a summary.

Mandatory Connections

It is imperative that the controller is connected as shown Figure 2, above, in order to ensure a safe and trouble-free operation. All connections shown as thick black lines line are mandatory. The controller must be powered On/Off using switch SW1 on the Power Control input.

Emergency Switch or Contactor

The battery must be connected in permanence to the controller's B+ terminal via a high-power emergency switch or contactor as additional safety measure. The user must be able to deactivate the switch or contactor at any time, independently of the controller state.

Electrostatic Discharge Protection

In accordance with IEC 61000-6-4, Roboteq Motor Controllers are designed to withstand ESD up to 4kV touch and 8kV air gap. This protection is implemented without any additional external connections required.

Some specifications, such as EN12895, require a higher level of protection. To maximize ESD protection, up to 8kV touch and 15kV air gap, you may connect the metallic heatsink of the controller to your battery negative terminal. [See App Note 062918 for example connections.](#)

Precautions and Optional Connections

Note 1: The power control (pin 25 on DSUB connector) must be grounded to turn off the controller. Floating the power control or connecting it to a battery will turn on the internal logic.

Note 2: A separate power supply may be used to power the controller's internal logic to keep the controller alive in case of voltage drop at the main battery because of motor load. **Voltage on Power Control pin must not exceed 50V Max. Make sure you correctly identified pin 25 before applying voltage to it.**

Note 3: Use precharge 100Ω, 10W Resistor to prevent switch arcing.

Note 4: Beware not to create a path from the ground pins on the I/O connector and the battery minus terminal.

Controller Mounting

During motor operation, the controller will generate heat that must be dissipated. The published amps rating can only be fully achieved if adequate cooling is provided. Good conduction cooling can be achieved by mounting the controller to a metallic surface, such as the chassis, cabinet, etc.

Sensor and Commands Connection

Connection to RC Radio, Microcomputer, Potentiometer, and other low current sensors and actuators is done via the 25-pin DSUB connectors and the 8-bit circular connector located at the top of the controller. The functions of many pins vary depending on controller configuration. Use mating connector Conxall/Switchcraft model 6282-8SG-3DC, or equivalent. The pin assignments are found in the Tables 1 and 2, below.

FIGURE 3. Circular Connector Pin Locations

TABLE 1.

Connector pin	Wire Color	Power	Ana	DOUT	Default Configuration
1	Red	+V5			
2	White				Unused
3	Green				Unused
4	Blue				Unused
5	Orange				Unused
6	Brown			DOUT5	Digital output
7	Yellow				Unused
8	Black	GND			

FIGURE 4. Main Connector Pin Locations

TABLE 2.

Connector Pin	Power	Dout	Com	Pulse	Ana	Dinput	Enc	Default Config
1	GND							
14	5VOut							
2			RSTxD					RS232Tx
15				Pln1 (2)	ANA1	DIN1		
3			RS RxD					RS232Rx
16				Pln2 (2)	ANA2	DIN2		
4				Pln3	ANA3	DIN3		AnaCmd1 (1)

12				Pln8	ANA8	DIN8	ENC1B	Unused
25	PwrCtrl							
13	GND							

Note 1: Analog commands are disabled in factory default configuration.
Note 2: Not recommended for MultiPWM.

For use in environments where liquid particles or fine dust may be present, the controller's cover is shaped for DSub connectors with waterproof hoods, as shown in Figure 5. Product references EDAC 627-230-025-010, CONEC 165X14839X or Assmann A-DS25-HOOD-WP

FIGURE 5. DSub Connector with Waterproof Hood

Enabling Analog Commands

For safety reasons, the Analog command mode is disabled by default. To enable the Analog mode, use the PC utility and set Analog in Command Priority 2 or 3 (leave Serial as priority 1). Note that by default the additional securities are enabled and will prevent the motor from starting unless the potentiometer is centered, or if the voltage is below 0.25V or above 4.75V. Use the PC utility to enable and assign analog inputs.

Connecting Thermistors

10 KOhm NTC temperature sensors can be connected to the controller's analog inputs. This enables reading of motor temperature through the controller's runtime variables and allows for active temperature protection. This connection can be achieved by using a 10 KOhm pull-up resistor between the analog input and the controller's 5V output. For more information about motor temperature readings and controller parameterization, please refer to the Roboteq Controller's User Manual.

RS485 Communication

The RGL18xxx has a half-duplex RS485 interface. Two signals are present on the 25-pin DSub connector for connecting to RS485 networks. Connecting these two wires with the correct polarity is all that is needed to establish a connection. The RS485+ is the positive signal and RS485- is the inverted signal. Once enabled, the RS485 can be used to communicate data under the Modbus protocol, or Roboteq's native serial commands.

Important Note

In some models, RS485 communication requires two 10 kΩ resistors to be connected to the A and B signals of the bus as follows:

- One resistor should be connected from the A signal to the controller's 5V output.
- One resistor should be connected from the B signal to the controller's ground.

CAN Bus Operation

The controller can interface to a standard CAN Bus network, using 4 possible protocols: Standard CANOpen, a simple and efficient meshed networking scheme (RoboCAN), and two simplified proprietary schemes (MiniCAN and RawCAN). Please refer to the User Manual for details.

Serial Communication

The controller has a full RS232 compatible serial interface. The serial port can easily be connected to devices with TTL serial using a simple resistor and diodes circuit. See user manual for details. The controller is equipped with three LED indicator lights, as shown in Figure 6:

FIGURE 6. Status LEDs

After the controller is powered on, the Power LED will turn on, indicating that the controller is On. The Status LED will be flashing at a two second interval. The flashing pattern provides operating or exception status information, as shown in Figures 7, 8, and 9:

FIGURE 7. Normal Operation Flashing Patterns

FIGURE 8. Exception or Fault Flashing Patterns

Additional status information may be obtained by monitoring the controller with the PC utility. The communication LED gives status information on the CAN and USB, as shown in Figure 9:

FIGURE 9. Communication LED

Battery Backed Clock and RAM

The controller includes a real-time clock/calendar and RAM storage for user variables. Both the clock and the RAM storage require a battery to continue running and for the stored data not to be lost while the controller is powered down. The battery is not installed by Roboteq. Users who wish to use the clock and/or battery backed RAM variables must install a battery themselves. The battery socket can be reached by removing the 6 screws that are holding the cover. Lift the cover to reach the board and insert a 3V, 12.5mm coin-style battery. Use battery type CR1225 or equivalent.

Measured Amps

Including Amps sensors on the wires allows for a fast and efficient feed of information. The controller has separate built in sensor for measuring the battery amps and the motor amps. Both motor amps and battery amps are measured in real time.

Electrical Specifications

Absolute Maximum Values

The values in the table below should never be exceeded, Permanent damage to the controller may result.

TABLE 3.

Parameter	Measure point	Model	Min	Typical	Max	Units
Battery Leads Voltage	Ground to VBat	RGDC1860			63	Volts
		RGDC1896			100	Volts
Reverse Voltage on Battery Leads	Ground to VBat	All	-1			Volts
Motor Leads Voltage	Ground to M+, M-	RGDC1860			63	Volts
		RGDC1896			100	Volts
Digital Output Voltage	Ground to Output pins	All			40	Volts
Power Control	Ground to PowerControl pin	All	-1		50	Volts
Analog and Digital Inputs Voltage	Ground to any signal pin on I/O connectors	All			25	Volts
RS232 pin Voltage	External voltage applied to Rx pins	All	-25		25	Volts
CAN pins Voltage	External voltage applied to CANH/CANL pins	All	-25		25	Volts
Temperature	Board	All	-40		85	°C
Humidity	Board	All			100 (3)	%
Note 1: Maximum regeneration voltage in normal operation. Never inject a DC voltage from a battery or other fixed source Note 2: No voltage must be applied on Tx pin Note 3: Non condensing

Motor Acceleration/Deceleration range	Motor current	All	100	500 (8)	65000	milliseconds
<p>Note 1: Voltage may drop to 0 if backup supply is connected to Power Control pin. Negative voltage will cause a large surge current. Protection fuse needed if battery polarity inversion is possible</p> <p>Note 2: Maximum regeneration voltage in normal operation. Never inject a DC voltage from a battery or other fixed source</p> <p>Note 3: Minimum voltage must be present on VBat or Power Control wire</p> <p>Note 4: Factory default value. Adjustable in 0.1V increments</p> <p>Note 5: Current consumption is lower when higher voltage is applied to the controller's VBat or PwrCtrl wires</p> <p>Note 6: Estimate. Limited by heatsink temperature. Current may be higher with better cooling</p> <p>Note 7: Factory default value. Adjustable in 0.1A increments</p> <p>Note 8: Factory default value. Time in ms for power to go from 0 to 100%</p> <p>Note 9: Controller will stop until zero command given in case of short circuit detection</p>						

Command, I/O and Sensor Signals Specifications

TABLE 6.

Parameter	Measure point	Min	Typical	Max	Units
5V Out Voltage	Ground to 5V pin	4.8	5.1	5.2	Volts
5V Output Current	Output to ground			100	mA
Digital Output Voltage	Ground to Output pins			40	Volts
Digital Output Current	Output pins, sink current			1	Amps
Digital Input 0 Level	Ground to Input pins	-1		1	Volts
Digital Input 1 Level	Ground to Input pins	3		25	Volts
Analog Input Range	Ground to Input pins	0		5.1	Volts
Analog Input Precision	Ground to Input pins		0.5		%
Pulse durations	Pulse inputs	20000		10	us
Pulse repeat rate	Pulse inputs	50		250	Hz
Pulse Capture Resolution	Pulse inputs		1		us
Minimum Pulse on or Pulse off duration	Pulse inputs	25			us
Frequency Capture	Pulse inputs	100		1000	Hz
Encoder count	Internal	-2.147		2.147	10 ⁹ Counts
Encoder frequency	Encoder input pins			200	kHz

Operating and Timing Specifications

TABLE 7.

Parameter	Measure Point	Min	Typical	Max	Units
Command Latency	Command to output change	0	1	2	ms
Maximum PWM duty cycle	Motor outputs			95.3	%
Closed Loop update rate	Internal		1000		Hz
Serial baud rate	Rx & Tx pins		115200 (1)		Bits/s
Serial Watchdog timeout	Rx pin	1 (2)		65000	ms
Note 1: 115200, 8-bit, no parity, 1 stop bit, no flow control Note 2: May be disabled with value 0					

Scripting

TABLE 8.

Parameter	Measure Point	Min	Typical	Max	Units
Scripting Flash Memory	Internal		32000	32768	Bytes
Integer Variables	Internal		4096		Words (1)
Boolean Variables	Internal		8192		Symbols
Execution Speed (2)	Internal	30,000		70,000	Lines/s
Note 1: 32-bit words Note 2: Execution Speed was calculated based on low communication load with the controller. In high communication workload, minimum time might be reduced drastically.					

Thermal Specifications

TABLE 9.

Parameter	Measure Point	Min	Typical	Max	Units
Board Temperature	PCB	-40		85 (1)	°C
Thermal Protection range	PCB	70		80 (2)	°C
Thermal resistance	Power MOSFETs to heats sink			2	°C/W
Note 1: Thermal protection will protect the controller power Note 2: Max allowed power out starts lowering at minimum of range, down to 0 at max of range					

Mechanical Specifications

TABLE 10.

Parameter	Measure Point	Min	Typical	Max	Units
Weight	Unit		2940 (6.48)		g (lbs)
Power Terminals	Connection		M6 (1)		Thread
Torque	D-sub standard connector		0.4 (3.54)		Nm (in-lbs)
Torque	Terminal block		0.8 (7.10)		Nm (in-lbs)
Torque	Mounting screws (4/M2.5)		0.36 (3.2)		Nm (in-lbs)
Note 1: Use M6 x 12mm long screws with washer between screw head and cable.
